

First-Time User Guide

This guide is for someone using the prototype for the first time. It explains the three most common tasks:

- 1 creating a new Pre-prod project
- 2 creating a new Prod project
- 3 checking and reopening existing projects

The prototype is intentionally lightweight. Some data is mocked, but the flows are designed to show the intended product behavior.

What A Project Means

A Project is the operating boundary for:

- 1 the selected agent
- 1 evaluation runs
- 1 validators
- 1 knowledge base setup
- 1 monitoring
- 1 session evaluation
- 1 operator controls such as revert and kill switch

When you create a project, you are not just naming a folder. You are creating the workspace in which the agent will be evaluated and monitored.

Create A New Pre-prod Project

Use this when you want to qualify a candidate agent version before it is promoted.

Steps

- 1 Open the Projects page.
- 2 Click New Project.
- 3 Enter a Project name.
- 4 Set Environment to Pre-Prod.
- 5 Select an Agent.
- 6 Select a Version.
- 7 Click Create pre-prod project.

What happens next

After creation, the prototype routes you into the prefilled pre-prod evaluation flow for that project.

The system uses the stored project context:

- 1 project name

- 1 environment = Pre-Prod
- 1 selected agent
- 1 selected version

You do not need to re-enter those values manually if the routing is working correctly.

What the user should do next

- 1 Review the prefilled evaluation setup.
- 2 Click Run Pre-prod Evaluation.
- 3 Wait for the run flow to start.

Expected behavior after the run starts

Once the pre-prod run is launched:

- 1 Session evaluation becomes available
- 1 Monitoring becomes available
- 1 the project can reopen into the launched run context instead of a generic landing page

When to use Pre-prod

Use Pre-prod when:

- 1 you are testing a candidate version
- 1 you want validator-driven qualification
- 1 you want the product to decide whether a version is promotable

Create A New Prod Project

Use this when you want to analyze live production behavior for an agent that is already in use.

Steps

- 1 Open the Projects page.
- 2 Click New Project.
- 3 Enter a Project name.
- 4 Set Environment to Prod.
- 5 Select an Agent.
- 6 Select a Data duration. Example options:
- 7 – 1 hr
- 8 – 2 hr
- 9 – 1 day
- 10 – 2 day
- 11 – 7 days
- 12 – 30 days

13 Click `Create prod project`.

What happens next

After creation, the prototype routes you into the prefilled production analysis flow for that project.

The system uses the stored project context:

- 1 project name
- 1 environment = Prod
- 1 selected agent
- 1 selected duration

What the user should do next

- 1 Review the prefilled production analysis setup.
- 2 Click `Run Production Analysis`.
- 3 Review the production run detail once it launches.

Expected behavior after the run starts

Once the prod run is launched:

- 1 the project stores the last launched run id
- 1 reopening the same project should return you to the most relevant run flow
- 1 Monitoring is available as a dedicated left-nav surface

When to use Prod

Use Prod when:

- 1 you want to analyze real production traffic
- 1 you want to check drift, health, and incidents
- 1 you want to inspect validator outcomes on live data

Check Existing Projects

Use the `Projects` page to browse and reopen work that already exists.

What to look for on the project card

Each project tile shows:

- 1 project name
- 1 short description
- 1 owner name
- 1 agent count
- 1 created date
- 1 environment chip:

- 1 – Pre-prod

- 1 – Prod

How to reopen a project

- 1 Go to Projects.
- 2 Find the project tile.
- 3 Click the tile.

Expected routing behavior

- 1 for default seeded projects:
 - 1 – clicking the project opens Evaluation Studio
- 1 for custom created projects:
 - 1 – if a run has already been launched, the project should reopen to the last launched run
 - 1 – if no run has been launched yet, the project should reopen into the prefilled evaluation setup for that project

How The Left Navigation Works

Once inside a project, the main prototype surfaces are:

- 1 Evaluation Studio
- 1 Mode hub
- 1 Knowledge Base
- 1 Session evaluation
- 1 Monitoring
- 1 Validators
- 1 Docs
- 1 Settings

Important behavior

Session evaluation and Monitoring are not just general pages. They are downstream project surfaces tied to the project state and run state.

For Pre-prod, they are expected to become meaningful after the evaluation run has started.

What Session Evaluation Is For

Session evaluation is where the user inspects:

- 1 stored sessions
- 1 stored traces
- 1 evaluator details
- 1 input/output views

- 1 transcript and session-level summaries

Use it when you want to drill into what happened in a seeded or launched evaluation run.

Important interaction

- 1 clicking a Session ID opens more details for that session
- 1 clicking a Trace ID opens more details for that trace

Those detail panels are where the user can inspect transcripts, evaluation summaries, evaluator findings, trace trees, and input/output payloads.

What Monitoring Is For

Monitoring is where the user inspects:

- 1 production run progression
- 1 health summaries
- 1 incident counts
- 1 drift behavior
- 1 operator controls such as revert and kill switch

Use it when you want to understand live production health and follow-up actions.

What Validators Are For

Validators is the project-level place to:

- 1 view built-in validators
- 1 create custom validators
- 1 configure model-based validator logic
- 1 manage benchmark behavior

Custom validator setup in the prototype currently focuses on:

- 1 name
- 1 description
- 1 model
- 1 model configurations
- 1 prompt
- 1 reference state

What Knowledge Base Is For

Knowledge Base is where the user sets up knowledge for the project.

The creation wizard now begins with:

- 1 General Settings
- 2 – knowledge base name

3 – description

Then continues into the ingestion flow.

Recommended First-Time Walkthrough

For a first-time demo, use this sequence:

- 1 open Projects
- 2 create a Pre-prod project
- 3 run the pre-prod evaluation
- 4 open Session evaluation
- 5 inspect a session and a trace
- 6 open Validators
- 7 review a validator configuration
- 8 open Knowledge Base
- 9 create a new knowledge base
- 10 create or open a Prod project
- 11 run production analysis
- 12 open Monitoring

This shows the full story of setup, evaluation, inspection, and governance.

Prototype Limitations

This is still a prototype, so keep these points in mind:

- 1 many datasets are dummy data
- 1 some flows are persisted in local client state
- 1 project creation is not backed by a real backend service
- 1 routing logic is designed to demonstrate expected product behavior, not final infrastructure

Summary

Use Pre-prod to qualify a candidate version before promotion. Use Prod to analyze live behavior over a chosen production window. Use existing project tiles to reopen the correct project context and continue evaluation, inspection, or monitoring.
